**HTScan® IKKβ Kinase Assay Kit**

- **Kit Quantity**: 5 1 7548
- **Products #**: n 2859
- **Kit Quantity**: 1.25 ml
- **Products #**: n 24x607

**Description**: The kit provides a means of performing kinase activity assays with recombinant human IKKβ kinase. It includes active IKKβ kinase (supplied as a GST fusion protein), a biotinylated peptide substrate and a phosphoserine antibody for detection of the phosphorylated form of the substrate peptide.

**Peptide Core Sequence**: DS*GLDS*M

**Molecular Weights**: Peptide substrate, Biotin-peptide: 2,085 Daltons. GST-IKKβ Kinase: 87 kDa.

**Background**: The NFκB/Rel transcription factors are present in the cytosol in an inactive state, complexed with the inhibitory IκB proteins (1-3). Most agents that activate NFκB do so through a common pathway based on phosphorylation-induced, proteasome-mediated degradation of IκB (3-7). The key regulatory step in this pathway involves activation of a high molecular weight IκB kinase (IKK) complex, whose catalysis is generally carried out by three tightly associated IKK subunits. IKKα and IKKβ serve as the catalytic subunits of the kinase. IKKγ serves as the regulatory subunit (8-9). Activation of IKK depends on phosphorylation-induced, proteasome-mediated degradation of the regulatory subunit (8-9). Activation of IKK depends on phosphorylation; serines 177 and 181 in the activation loop of IKKγ (176 and 180 in IKKα) are the specific sites whose phosphorylation causes conformational changes resulting in kinase activation (10-13).

**Source/Purification**: The GST-Kinase fusion protein was produced using a baculovirus expression system with a construct expressing full length human IKKβ (Met1-Ser756) (GenBank Accession No. AF029684) with an amino-terminal GST tag. The protein was purified by one-step affinity chromatography using glutathione-agarose.

**Quality Control**: The substrate peptide was selected for use in IKKβ kinase activity assays with recombinant human IKKβ (4) and mass spectrometry. Purified IKKβ kinase was quality controlled for purity by SDS-PAGE followed by Coomassie stain and Western blot. The specific activity of the IKKβ kinase was determined using a radiometric assay [Fig.1]. Time course [Fig.2], kinase dose dependency [Fig.3] and substrate dose-dependency [Fig.4] assays were performed to verify IKKβ activity using the IKKβ substrate peptide provided in this kit. IKKβ sensitivity to the inhibitor staurosporine was measured using the IKKβ substrate peptide provided in this kit [Fig.5].
