Active Arf1 Detection Kit

1 Kit
(30 immunoprecipitations)

Species Cross-Reactivity: H, M

Description: The Active Arf1 Detection Kit provides all reagents necessary for measuring activation of Arf1 GTPase in the cell. GST-GGA3-PBD fusion protein is used to bind the activated form of GTP-bound Arf1, which can then be immunoprecipitated with glutathione resin. Arf1 activation levels are then determined by western blot using an Arf1 Rabbit mAb.

Specificity/Sensitivity: Active Arf1 Detection Kit detects endogenous levels of GTP-bound (active) Arf1 as shown in Figure 1. This kit detects proteins from the indicated species, as determined through

Background: The Ras superfamily of small GTP-binding proteins (G proteins) comprise a large class of proteins (over 150 members) that can be classified into at least five families based on their sequence and functional similarities: Ras, Rho, Rab, Arf, and Ran (1-3). These small G proteins have both GDP/GTP-binding and GTPase activities and function as binary switches in diverse cellular and developmental events that include cell cycle progression, cell survival, actin cytoskeletal organization, cell polarity and movement, and vesicular and nuclear transport (1). An upstream signal stimulates the dissociation of GDP from the GTP-bound form (inactive), which leads to the binding of GTP and formation of the GTP-bound form (active). The activated G protein then goes through a conformational change in its downstream effector-binding region, leading to the binding and regulation of downstream effectors. This activation can be switched off by the intrinsic GTPase activity, which hydrolyzes GTP to GDP and releases the downstream effectors. These intrinsic guanine nucleotide exchange and GTP hydrolysis activities of Ras superfamily proteins are also regulated by guanine nucleotide exchange factors (GEFs) that promote formation of the active GTP-bound form and GTPase activating proteins (GAPs) that return the GTPase to its GDP-bound inactive form (4).

ADP-ribosylation factor (Arf) proteins are low molecular weight GTP binding proteins that belong to the Ras GTPase superfamily. Arf proteins are grouped into three distinct classes based on amino acid sequence and structural similarity. Arf1 is a class I Arf protein and is involved in the budding of vesicles from the Golgi (1).

Figure 1. NIH/3T3 cell lysates (500 µl at 1 mg/ml) were treated in vitro with GTPγS or GDP to activate or inactivate Arf1 (refer to optional step C in protocol). The lysates were then incubated with glutathione resin and GST-GGA3-PBD (lanes 2 and 3). GTPγS-treated lysate was also incubated without GST-GGA3-PBD in the presence of glutathione resin as a negative control (lane 4). Western blot analysis of cell lysate (20 µg, lane 1) or 20 µl of the eluted samples (lanes 2, 3, and 4) was performed using an Arf1 Rabbit mAb. Anti-rabbit IgG, HRP-linked Antibody #7074 was used as the secondary antibody. Detection was performed using 1X LumiGLO® reagent and peroxide (20X LumiGLO® Reagent and 20X Peroxide #7003), followed by exposure to x-ray film.

Figure 2. The GTP-bound GTPase pull-down process can be divided into 3 steps as shown. Step 1: Mix sample, binding protein, and 20X Peroxide (20X LumiGLO® Reagent and peroxide (20X LumiGLO® Reagent and 20X Peroxide #7003), followed by exposure to x-ray film.

Active Arf1 Detection Kit Protocol

Additional Materials Required
Phenylmethanesulfonyl fluoride (PMSF) #8553
Dithiothreitol (DTT), 1.25 M
Tris-buffered saline (TBS)
Tween-20
10X TBS/T: 10X TBS, 1% Tween-20 #9997
Primary antibody dilution buffer: 1X TBST 5% BSA
Bovine Serum Albumin (BSA) #9998
Nonfat Dry Milk #9999
Prestained Protein Marker, Broad Range (Premixed Format) #7720
Biotinylated Protein Ladder Detection Pack #7727
Anti-mouse IgG, HRP-linked Antibody #7076
Prestained Protein Marker, Broad Range (Premixed Format) #7720
Dithiothreitol (DTT), 1.25 M
Phenylmethanesulfonyl fluoride (PMSF) #8553
Anti-mouse IgG, HRP-linked Antibody #7076
Biotinylated Protein Ladder Detection Pack #7727
Prestained Protein Marker, Broad Range (Premixed Format) #7720
Nonfat Dry Milk #9999
Prestained Protein Marker, Broad Range (Premixed Format) #7720
Dithiothreitol (DTT), 1.25 M
Phenylmethanesulfonyl fluoride (PMSF) #8553
Anti-mouse IgG, HRP-linked Antibody #7076
Biotinylated Protein Ladder Detection Pack #7727
Prestained Protein Marker, Broad Range (Premixed Format) #7720
Nonfat Dry Milk #9999
Prestained Protein Marker, Broad Range (Premixed Format) #7720
Dithiothreitol (DTT), 1.25 M
Phenylmethanesulfonyl fluoride (PMSF) #8553

A Solutions and Reagents
NOTE: Prepare solutions with ddH₂O or equivalently purified water.
1X Phosphate Buffered Saline (PBS)
1X Cell Lysis/Binding/Wash Buffer
NOTE: Add 1 mM PMSF immediately prior to use.

B Cell Lysis
1. To harvest cells under nondenaturing conditions, remove media and rinse cells once with ice-cold PBS. For non-adherent cells, pellet cells at 100g for 5 min and resuspend cells in 10 ml ice-cold PBS.
2. Remove PBS and add 0.5 ml ice-cold 1X Lysis/Binding/Wash Buffer plus 1 mM PMSF to each plate (10 cm in diameter), or cell pellets from each 75 cm² flask (approx 1-2 x 10⁶ cells).
3. Scrape cells off the plate and transfer to an appropriate tube. For non-adherent cells, just resuspend the pellet.
4. Vortex the tube briefly and incubate on ice for 5 min.
5. Microcentrifuge at 16,000g at 4°C for 15 min and transfer the supernatant to a new tube. The supernatant is the cell lysate. Fresh cell lysates are recommended for GTPase assays. Lysate protein concentration can be determined using BCA protein assay.
NOTE: We recommend making 1 mg/ml lysate in 1X Lysis/Binding/Wash Buffer for the following steps.

C In vitro GTPγS or GDP Treatment (Optional)
Perform the following treatments, GTPγS (positive control) and GDP (negative control), to ensure the immunoprecipitation procedures are working properly. Use 500 µg of cell lysate for each treatment. For best results, aliquot GTPγS and GDP at first use to minimize freeze/thaw cycles.
1. For 500 µl lysate, add 10 µl 0.5 M EDTA pH 8.0 (for a final concentration of 10 mM), vortex the sample.
2. Add 5 µl of 10 mM GTPγS (for a final concentration of 0.1 mM) or 5 µl 100 mM GDP (for a final concentration of 1 mM), vortex the sample.
3. Incubate the mixture at 30°C for 15 min with constant agitation.
4. Terminate the reaction by placing the sample on ice and adding 32 µl of 1 M MgCl₂ (for a final concentration of 60 mM), vortex the sample.

D Affinity Precipitation of Activated G protein
1. Insert a spin cup into a collection tube for each sample.
2. Swirl the bottle of glutathione resin to thoroughly resuspend the agarose beads. Add 100 µl of the 50% resin slurry to the spin cup with collection tube. Centrifuge the tubes at 6,000xg for 10-30 sec.
3. Discard the flow-through. Add 400 µl of 1X Lysis/Binding/Wash Buffer to each spin cup with resin. Invert the tubes gently several times. Centrifuge the tubes at 6,000xg for 10-30 sec. Discard the flow-through.
4. Thaw the GST-GGA3-PBD on ice and immediately make 100 µl aliquots. Store aliquots for later use at -80°C.
5. Add 100 µg of GST-GGA3-PBD to the spin cup containing the glutathione resin.
6. Immediately transfer up to 700 µl of the cell lysate (containing at least 500 µg of total protein) to the spin cup, close the cap and vortex the sample.
7. Seal cap of the collection tube with laboratory film to prevent leakage, which may result from the presence of detergent in the lysate, vortex the sample.
8. Incubate the reaction mixture at 4°C for 1 hr with gentle rocking.
9. Centrifuge the spin cup with collection tube at 6,000xg for 10-30 sec. Remove the laboratory film and transfer the spin cup to a new collection tube.
10. To wash resin, add 400 µl of 1X Cell Lysis/Binding/Wash Buffer. Invert the tube three times, and centrifuge at 6,000xg for 10-30 sec. Discard the buffer. Repeat this wash step two additional times.
11. Transfer the spin cup to a new collection tube.
12. Prepare 50 µl of reducing sample buffer for each pull-down reaction by adding dithiothreitol (DTT) to 2X SDS Sample Buffer to a final concentration of 200 mM.
13. Add 50 µl 2X reducing sample buffer to the resin. Vortex the sample and incubate at room temperature for 2 min.
14. Centrifuge the tube at 6,000xg for 2 min. Remove and discard the spin cup containing the resin.
15. Heat the eluted samples for 5 min at 95-100°C. Samples may be electrophoresed on a gel or stored at -20°C for future use.

E Western blot analysis
NOTE: Volumes are for 10 cm x 10 cm (100 cm²) of membrane; for different sized membranes, adjust volumes accordingly.
1. Load 20-25 µl onto SDS-PAGE gel (10 cm x 10 cm).
NOTE: CST recommends loading prestained molecular weight markers (#7720, 10 µl/ lane) to verify electrophoresis and biotinylated ladder (#7727, 10 µl/ lane) to determine molecular weights. 4-20% acrylamide or Tris-glycine gel provides best separation.
2. Electrotransfer to nitrocellulose membrane.
3. After transfer, wash nitrocellulose membrane with 25 ml TBS for 5 min at room temperature.
4. Incubate membrane in 25 ml of blocking buffer (TBS containing 0.1% Tween-20 and 5% BSA) for 1 hr at room temperature.
5. Wash three times for 5 min each with 15 ml of 1X TBST.
6. Incubate membrane with Arf1 Rabbit antibody (1:2000 dilution) in 10 ml primary antibody dilution buffer with gentle agitation overnight at 4°C.
7. Wash three times for 5 min each with 15 ml of 1X TBST.
8. Incubate membrane with Anti-rabbit IgG, HRP-linked antibody (1:2000, #7074) and HRP-conjugated anti-biotin antibody (1:1000, #7075) to detect biotinylated protein markers in 10 ml of 1X TBST containing 5% milk with gentle agitation for 1 hour at room temperature.
9. Wash three times for 5 min each with 15 ml of 1X TBST.
10. Incubate membrane with 10 ml LumiGLO® (0.5 ml 20X LumiGLO®, 0.5 ml 20X Peroxide, #7003, and 9.0 ml ddH₂O) with gentle agitation for 1 hr at room temperature. NOTE: LumiGLO® substrate can be further diluted if signal response is too fast.
11. Drain membrane of excess developing solution (do not let dry), wrap in plastic wrap and expose to light film. An initial 10-s exposure should indicate the proper exposure time. NOTE: Due to the kinetics of the detection reaction, signal is most intense immediately following LumiGLO® incubation and declines over the following 2 hr.

LumiGLO® is a registered trademark of Kirkegaard & Perry Laboratories.
